

BESS Telecom Energy Storage Project Construction Time

Does a Bess system use a lot of power?

While charging and discharging happen at the grid-level interconnection to the utility as part of the revenue stream for the project, BESS systems themselves can consume a significant amount of power not directly related to the charging or discharging of batteries.

How important is a Bess project?

As grid modernisation gains traction, these systems will play an increasingly important role in meeting the ever-growing demand for clean, reliable power. However, the development of BESS projects comes with its own formidable set of challenges.

Is Bess a new technology?

As BESS is a relatively new technology, regulations and standards are currently diverse and evolving at local, national, and international levels. There is currently not the same body of knowledge available that exists for more established installation types. Furthermore, regulatory requirements may change during the project lifecycle.

What are the basic utilities required for a Bess project?

Basic Utility Access Requirements Some may underestimate the basic utilities required for the construction and operation phases of BESS projects, which are most commonly water, power, and communications. The unthinkable happens - there is a fire on the BESS equipment, and access to water is needed.

Do I need to provide power to a Bess project?

State laws and system operator requirements vary by location, but there is often a requirement to provide power to some of the non-battery-charging loads with retail power (i.e., not wholesale power sourced from the grid level that your BESS project is connected to).

What happens if a Bess facility is not planned?

During the construction stage, native soil is disturbed and moved to build a reliable BESS facility. In urban areas, if proper planning and control is not planned into the design, this can leave downstream communities at risk of increased sediment and stormwater runoff.
