

Design requirements for photovoltaic grid-connected inverters

What are the requirements for a solar inverter system?

There are two main requirements for solar inverter systems: harvest available energy from the PV panel and inject a sinusoidal current into the grid in phase with the grid voltage. In order to harvest the energy out of the PV panel, a Maximum Power Point Tracking (MPPT) algorithm is required.

What standards should a grid connected solar system follow?

Standards Relevant to Design of Grid Connected PV Systems System designs should follow any standards that are typically applied in the country or region where the solar installation will occur as well as any additional standards specific to the island country where the installation is located.

How do I design a grid connected PV system?

This document provides the minimum knowledge required when designing a grid connected PV system. Design criteria may include: Wanting to reduce the use of fossil fuel in the country or meet other specific customer—related criteria. Determining the energy yield, specific yield and performance ratio of the grid connected PV system.

What is the control design of a grid connected inverter?

The control design of this type of inverter may be challenging as several algorithms are required to run the inverter. This reference design uses the C2000 microcontroller(MCU) family of devices to implement control of a grid connected inverter with output current control.

Can grid-connected PV inverters improve utility grid stability?

Grid-connected PV inverters have traditionally been thought as active power sources with an emphasis on maximizing power extraction from the PV modules. While maximizing power transfer remains a top priority, utility grid stability is now widely acknowledged to benefit from several auxiliary services that grid-connected PV inverters may offer.

What voltage should a solar inverter be connected to?

For the best performance of the system the output voltage of the solar array should be matched to the operating voltages of the MPPT it is connected to in the inverter. To minimise the risk of damage to the inverter the maximum voltage of the inverter should never be reached.
