

Electric energy storage peak load regulation and frequency regulation system solution

What are advanced energy storage systems (ESS)?

Various advanced ESS have emerged, including battery energy storage system (BESS), super-capacitor, flywheel, superconducting magnetic energy storage. These systems are interconnected with the power grid to facilitate the penetration of renewable energy and to address frequency and peak regulation demand.

Do flexible resources support multi-timescale regulation of power systems?

Here, we focused on this subject while conducting our research. The multi-timescale regulation capability of the power system (peak and frequency regulation, etc.) is supported by flexible resources, whose capacity requirements depend on renewable energy sources and load power uncertainty characteristics.

What is the role of FESS in load frequency regulation?

Notably, FESS finds an instrumental role in load frequency regulation, involving the adjustment of power system frequency and output to match the demand. Load frequency regulation is essential for maintaining the stability and reliability of the power grid.

How a hybrid energy storage system can support frequency regulation?

The hybrid energy storage system combined with coal-fired thermal power plant in order to support frequency regulation project integrates the advantages of "fast charging and discharging" of flywheel battery and "robustness" of lithium battery, which not only expands the total system capacity, but also improves the battery durability.

What is the power and capacity of ES peaking demand?

Taking the 49.5% RE penetration system as an example, the power and capacity of the ES peaking demand at a 90% confidence level are 1358 MW and 4122 MWh, respectively, while the power and capacity of the ES frequency regulation demand are 478 MW and 47 MWh, respectively.

Does ES capacity enhance peak shaving and frequency regulation capacity?

However, the demand for ES capacity to enhance the peak shaving and frequency regulation capability of power systems with high penetration of RE has not been clarified at present. In this context, this study provides an approach to analyzing the ES demand capacity for peak shaving and frequency regulation.
