

# Energy storage lithium batteries are connected in parallel to expand capacity

Why do lithium ion batteries need to be connected in series?

To meet the power and energy requirements of the specific applications, lithium-ion battery cells often need to be connected in series to boost voltageand in parallel to add capacity. However, as cell performance varies from one to another [2,3], imbalances occur in both series and parallel connections.

### Why should lithium batteries be connected in parallel?

Lithium batteries in parallel connection share the electrical load evenly,reducing strain on individual cells. This results in a more balanced discharge cycle,which enhances overall battery life and prevents premature wear. When properly managed,parallel systems distribute power efficiently,ensuring that no single battery is overworked. 3.

What are the advantages of a parallel battery connection?

1. Increased Capacity and Extended RuntimeOne of the primary advantages of parallel connection is the ability to increase battery capacity. When multiple lithium batteries are connected in parallel,their total ampere-hour (Ah) rating is the sum of all individual batteries, while the voltage remains unchanged.

### Can you mix different capacity lithium batteries?

Yes, you can mix different capacity lithium batteries, whether a normal 12V 100Ah battery or a Lithium server rack battery. You can combine different capacity batteries in parallel. You cannot combine different capacity batteries in series. There are a few points you need to consider when wiring in parallel. Let's explore these three points.

### Do batteries in parallel increase capacity?

In summary, batteries in parallel can definitely increase capacity as they combine their individual capacities. This can be a great solution for those who need more power without having to invest in a larger battery.

#### What is a parallel lithium battery?

Uninterruptible power supplies (UPS) and off-grid energy systems benefit from parallel lithium battery configurations, ensuring extended backup power in case of outages. These setups are commonly used in remote locations, data centers, and emergency power solutions.
