How do flow batteries work?

K. Webb ESE 471 3 Flow Batteries Flow batteries are electrochemical cells, in which the reacting substances are stored in electrolyte solutions external to the battery cell Electrolytes are pumped through the cells Electrolytes flow across the electrodes Reactions occur at the electrodes Electrodes do not undergo a physical change Source: EPRI

What are the different types of flow batteries?

Flow battery design can be further classified into full flow, semi-flow, and membraneless. The fundamental difference between conventional and flow batteries is that energy is stored in the electrode material in conventional batteries, while in flow batteries it is stored in the electrolyte.

Do flow batteries need a fluid model?

Flow batteries require electrolyte to be pumped through the cell stack Pumps require power Pump power affects efficiency Need a fluid model for the battery in order to understand how mechanical losses affect efficiency K. Webb ESE 471 29 RFB Fluid Model Power required to pump electrolyte through cell stack Pumping power is proportional to

What are the components of a flow battery?

Flow batteries comprise two components: Electrochemical cell Conversion between chemical and electrical energy External electrolyte storage tanks Energy storage Source: EPRI K. Webb ESE 471 5 Flow Battery Electrochemical Cell Electrochemical cell Two half-cells separated by a proton-exchange membrane (PEM)

What is the difference between power and power in flow batteries?

The key differentiating factor of flow batteries is that the power and energy components are separate and can be scaled independently. The capacity is a function of the amount of electrolyte and concentration of the active ions, whereas the power is primarily a function of electrode area within the cell.

How does flow factor affect battery efficiency?

Linking with Eq. 22, the higher the current, the greater the flow rate needed; therefore, the pressure losses will increase, implying a higher need for pump power. This probably directly limits the value of the flow factor. Knowing the optimum flow factor for battery operation is of great interest to optimize battery efficiency.

OverviewHistoryDesignEvaluationTraditional flow batteriesHybridOrganicOther typesA flow battery, or redox flow battery (after reduction-oxidation), is a type of electrochemical cell where chemical energy is provided by two chemical components dissolved in liquids that are pumped through the system on separate sides of a membrane. Ion transfer inside the cell (accompanied by current flow through an external circuit) occurs across the membrane while the liquids circulate in their respective spaces.
