

What is Iran's energy supply?

In 2020, the Total Energy Supply (TES) in Iran was predominantly derived from natural gas (69%) and oil (29%), with nuclear power and renewable sources contributing only 1% each. Despite the heavy reliance on fossil fuels, Iran possesses significant potential for renewable energy.

How much electricity can Iran produce?

It has been estimated that Iran has the potential to produce at least 6,150 MWh of electricity by wave power from its coastline on the Persian Gulf alone. Iran is also experimenting with electricity generation from organic wastes and plans to build power plants using sewage and organic waste of domestic and industrial origin as fuel.

How much solar power does Iran have?

Iran has an average of 2,200 kilowatt-hours of solar radiation per square meter annually, and 90% of the country has enough sun to generate solar power 300 days a year. In 2020 there were just over 300 MW of wind power, less than 1% of installed capacity.

Why is Iran getting so much electricity in 2022?

According to a 2022 U.S. Energy Information Administration (EIA) report, Iran has experienced escalating electricity demand driven by factors including illegal cryptocurrency mining, population growth, highly subsidized electricity prices, and fuel supply shortages.

What percentage of Iran's energy is based on natural gas?

Of that amount, about 75 percent was based on natural gas, 18 percent on oil, and 7 percent on hydroelectric power. However, in 2004 Iran opened its first wind-powered and geothermal plants, and the first solar thermal plant was to come online in 2009.
