

Are lead-acid batteries a good choice for energy storage?

Operational experience Lead-acid batteries have been used for energy storage in utility applications for many years but it has only been in recent years that the demand for battery energy storage has increased.

Do lithium-ion batteries have fewer environmental impacts than lead-acid batteries?

The lithium-ion batteries have fewer environmental impacts than lead-acid batteries for the observed environmental impact categories. The study can be used as a reference to decide how to substitute lead-acid batteries with lithium-ion batteries for grid energy storage applications.

Why do lithium ion batteries outperform lead-acid batteries?

The LIB outperform the lead-acid batteries. Specifically, the NCA battery chemistry has the lowest climate change potential. The main reasons for this are that the LIB has a higher energy density and a longer lifetime, which means that fewer battery cells are required for the same energy demand as lead-acid batteries.

Fig. 4.

Do lead-acid batteries affect the environment?

Received 3rd March 2025 , Accepted 15th May 2025 Although lead-acid batteries (LABs) often act as a reference system to environmentally assess existing and emerging storage technologies, no study on the environmental impact of LABs based on primary data from Europe or North America since 2010 could be found.

Why do lead-acid batteries produce more impact than Lib batteries?

In general, lead-acid batteries generate more impact due to their lower energy density, which means a higher number of lead-acid batteries are required than LIB when they supply the same demand. Among the LIB, the LFP chemistry performs worse in all impact categories except minerals and metals resource use.

Which battery chemistries are best for lithium-ion and lead-acid batteries?

Life cycle assessment of lithium-ion and lead-acid batteries is performed. Three lithium-ion battery chemistries (NCA, NMC, and LFP) are analysed. NCA battery performs better for climate change and resource utilisation. NMC battery is good in terms of acidification potential and particulate matter.

This research contributes to evaluating a comparative cradle-to-grave life cycle assessment of lithium-ion batteries (LIB) and lead-acid battery systems for grid energy storage ...

Lead acid battery cycle life will degrade quicker at higher temperatures. For every 15°F above 75°F the cycle life of a lead acid battery is reduced by half. Lightweight: At only 30lbs each, a ...

In 1997, researchers made two important advancements to lead-acid batteries. First, the Japan Storage Battery Company showed that adding carbon to the battery dramatically reduces the ...

Lithium-ion vs. Lead Acid: Performance, Costs, and Durability A techno-economic analysis in the Journal of Energy Storage titled "" Techno-economic analysis of lithium-ion and lead-acid ...

To close this research gap, this work provides a cradle-to-grave life cycle assessment (LCA) of an industrial LAB based on up-to-date primary data provided by the ...

How to reduce lead-acid battery sulfation? The lead-acid battery sulfation mitigation is achieved with the consideration of proper charging and discharging controller. In author designed Fuzzy ...

Finally, the comparative study led to significant conclusions regarding the specific attributes of both battery technologies analyzed through the operation, revealing that Li-ion is a ...

Feasibility study of renewable energy-based microgrid system ... Ref. Jahangir et al. (2019b) indicated that LCOE of the optimal case using lead-acid battery is highly sensitive to capital ...
