

## Temperature control management measures for energy storage power stations

What is battery thermal management (BTM)?

Battery thermal management (BTM) is a crucial aspect for achieving optimum performance of a Battery Energy Storage System (BESS) (Zhang et al.,2018). Battery thermal management involves monitoring and controlling the temperature of the battery storage system oensure that the battery is always operated within a safe temperature range.

Why is temperature monitoring important in battery storage systems?

Continuous temperature monitoring and feedback response in the battery storage system is essential for ensuring battery safety and protecting the battery pack from any possible hazard conditions\*(Aghajani and Ghadimi,2018)\*. This enhances the stability of grid-connected RESs or microgrids that contain BESS.

Why are control strategies important in temperature monitoring?

Control strategies are important for effective temperature monitoring, which has gained a competitive advantage.

What is a probabilistic energy management system?

A probabilistic energy management system refers to energy and operation management of a microgrid containing wind/photovoltaic/fuel cell generation and energy storage devices based on point estimate method and self-adaptive gravitational search algorithm.

How can a battery energy storage system help decarbonize the grid?

Battery energy storage systems (BESS) can help decarbonize the grid by providing a new, carbon-free source of operational flexibility and enhancing the use of generation resources. Furthermore, they promote the incorporation of flexible RES.

Do air-based thermal management systems provide more cooling power?

Studies have been found that, for a rated power of less than 1 kW, passive air-based thermal management systems are able to provide more cooling power than active systems(Al-Zareer et al., 2018b). Fig. 3 illustrates an example of an air-based thermal management system (Pesaran, 2001).

Managing temperatures in energy storage systems (ESS) is like teaching a penguin to survive in the Sahara. Most lithium-ion batteries perform best between 15°C to 35°C.
