

What size 12 volt inverter should I choose

What is a 12 volt inverter?

An inverter is a device that turns the power from a 12 volt DC battery, like the one in your car or truck, into the 120 volt AC power that runs all of the electronics in your house. You can use one of these devices to power all sorts of devices in your car, but it's important to figure out how big of an inverter you need first.

How do I choose the right inverter size?

Here is our last bit of advice on how to select the correct inverter size: Check our inverter size chart. List all your appliances in the function of their power output. Apply our inverter size formula. Do not exceed 85% of your inverter's maximum power continuously. Oversize your inverter for extra appliances in the future.

How much volt drop should a 12 volt inverter have?

Australian Standards say we should keep our volt-drop under 5% or 0.6 Volts on a 12Volt system, but with high-power inverters it's best to keep this around 0.2 Volts so we don't waste power in the cables. The volt-drop calculator is useful here, and allows us to choose a cable that will maximise the power into the inverter.

Do I need a 230 volt inverter?

Do whatever makes you happy and don't let anyone tell you, you can't! If you want to run 230/240-volt appliances, you will either need a 12/230V Inverter or a 230V Generator. They are your only options. When calculating an Inverter size, you will need to calculate the normal operating power (continuous power) in Watts.

How much power does an inverter need?

The continuous power requirement is actually 2250 but when sizing an inverter, you have to plan for the start up so the inverter can handle it. Third, you need to decide how long you want to run 2250 watts. Let's say you would like to power these items for an eight-hour period.

How to choose a power inverter?

Second, select an inverter. For this example, you will need a power inverter capable of handling 4500 watts. The continuous power requirement is actually 2250 but when sizing an inverter, you have to plan for the start up so the inverter can handle it. Third, you need to decide how long you want to run 2250 watts.
