

## What supporting facilities are available for energy storage projects

What is an energy storage system?

An energy storage system (ESS) for electricity generationuses electricity (or some other energy source, such as solar-thermal energy) to charge an energy storage system or device, which is discharged to supply (generate) electricity when needed at desired levels and quality. ESSs provide a variety of services to support electric power grids.

How many energy storage projects are planned in 2023?

All other planned energy storage projects reported to EIA in various stages of development are BESS projects and have a combined total nameplate power capacity additions of 22,255 MWplanned for installation in 2023 through 2026. About 13,881 MW of that planned capacity is co-located with solar photovoltaic generators.

What are the different types of energy storage systems?

In practice these systems can include ice storage systems that use electricity to freeze ice which can later be used to run a cooling system, or a heating system that heats bricks in a furnace to later provide heat to a building. Fuel cells: hydrogen fuel cells comprise a third category of energy storage system.

Do energy storage projects need a lot of land?

Lower land use requirements: energy storage projects are typically concentrated blocks of batteries or other storage devices, which can require a fraction of the land use of other renewable resources for a comparable nameplate generating capacity.

What are energy storage technologies?

IRS defines these technologies as energy storage property which is connected to a building heating or cooling system and removes heat from (or adds heat to) a storage medium for subsequent use, and provides energy for heating or cooling a commercial or residential building.

How many flywheel energy storage systems are there in 2022?

In 2022, the United States had fouroperational flywheel energy storage systems, with a combined total nameplate power capacity of 47 MW and 17 MWh of energy capacity. Two of the systems, one in New York and one in Pennsylvania, each have 20 MW nameplate power capacity and 5 MWh of energy capacity.
