

Which inverters have sufficient power

Does a large inverter need a lot of power?

The inverter requires some power just to run itself, so the efficiency of a large inverter will be low when running very small loads. In a typical home, there are many hours of the day when the electrical load is very low.

Which Inverter should I Choose?

Pumps, compressors and air conditioners are the most common example and another common one is freezers and refrigerators (compressors). You want to select an inverter with a continuous rating that will handle the surge rating of your appliance so you don't prematurely burn out the inverter.

How efficient is an inverter?

In a typical home, there are many hours of the day when the electrical load is very low. Under these conditions, an inverter's efficiency may be around 50 percent or less. The full story is told by a graph of efficiency vs. load, as published by the inverter manufacturer.

What makes a good inverter?

Be careful and honest if you contemplate avoiding all phantom and idling loads. You cannot always anticipate future needs or human behavior. A good inverter is an industrial quality device that is proven reliable, certified for safety, and can last for decades. A cheap inverter may soon end up in the junk pile, and can even be a fire hazard.

Do I need a DC inverter?

There are ways to use DC directly, but for a modern lifestyle, you will need an inverter for the vast majority, if not all of your loads (loads are devices that use energy). Incidentally, there is another type of inverter called grid-interactive.

What is a good efficiency rating for an inverter?

Most modern inverters have efficiency ratings between 90% and 98%. Let's break it down: If you feed 1000 watts of DC power into your inverter and it outputs 950 watts of AC power, your inverter efficiency is 95%. The other 50 watts were lost in the conversion process--mostly as heat.

In simple terms, inverter efficiency refers to how well an inverter converts DC electricity into usable AC power. No inverter is 100% efficient--some energy always gets lost ...
